Draft entry and hard copy of sequence for [1] kindly provided by J.J.Ferretti, 03-SEP-1985.

The -35 and -10 regions are located at positions 760-765 and 781-786 respectively and an SD sequence at 808-813. Downstream from the coding region inverted repeats (positions 2176-2190 and 2203-2217) are thought to function as transcription terminators. The nucleotide sequence of skc does not support the hypothesis that the gene has evolved by duplication and fusion, as suggested by internal two-fold AA homologies of its product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /organism="Streptococcus dysgalactiae subsp. equisimilis"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                   The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; cc (2) a method for dissolving a blood clot in a subject, comprising a daministering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a compression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial configuration that thrombosis, pulmonary embolism, cerebral thrombosis, graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates a substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence encodes native streptokinase (SK). (Updated on 17-OCT-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        유
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LysSerValAspValGluTyrThrValGlnPheThrProLeuAsnProAspAspAspPhe 160
                                                                                                                                                                                                                         The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProSa-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence encodes native SK. SK is a secretory protein of haemolytic. Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vacular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the KS9E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                        streptokinase coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase coding sequence. The invention relates to a hybrid plasminogen activation, which are from fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the binding domains or laman about the plant of the PA to a suitable pronounced duration, or lag, after exposure of the PA to a suitable pronounced duration, or lag, after exposure of the PA to a suitable pronounced duration, or lag, after exposure of the PA to a suitable pronounced duration, or lag, after exposure of the PA to a suitable cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in the natural are of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       351
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       471
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LysSerValAspValGluTyrThrValGlnPheThrProLeuAsnProAspAspAspPhe 160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       291
                                                                                                                                                                                                                                                                                       The invention relates to a fusion protein or a conjugate comprising a vasodilator polypeptide, or its active fragment, and a thrombolytic polypeptide or its active fragment. The protein is useful for treating a subject suffering from a partially or totally occluded blood vessel, causing unstable angina, acute myocardial infarction or stroke. The vasodilatory action of the protein allows for the use of lower doses of thrombolytic, while maintaining the clot dissolving effectiveness of the thrombolytic, and the use of lower doses of the thrombolytic, and the use of lower doses of the thrombolytic, and the use of lower sequence is the streptokinase cDNA used in the construction of a Maxadilan-Streptokinase fusion protein. Maxadilan is a vasodilator peptide produced by the salivary gland of the New World sand fly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40

                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                             The 5' end of the coding strand overhangs the 3' end of the complementary strand by 4 bases; the 5' end of the complementary strand overhangs the 3' end of the sense strand by AGCT. The sequence encoding streptokinase was first divided into 52 oligonucleotide fragments of 43-56 bases each. The individual fragments were synthesised by solid-phase beta-cyanomethyl phosphoamidide method, phosphate groups added and the fragments ligated to obtain pSKK. This was inserted into expression vector pKTN2-2 and used see also AAR10195-R10200

This sequence represents a streptokinase-NTR (SK-NTR) gene (where NTR stands for N-terminally repaired with native sequence). The invention relates to a hybrid plasminogen activator (PA) comprises a polygeptide fusion between streptokinase (SK), which are capable of plasminogen (EC fusion between streptokinase (SK), which are capable of plasminogen (PC) activation, and fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind'tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus adding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)
thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin.
                                                                                           Example 1; Fig 14; 58pp; English.

XX

Hybrid streptokinase-fibrin binding domain polypeptides useful for domains of human fibrocomprises a streptokinase fused with fibrin binding domains of human fibrocomprises.

PT thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibrocomprises.

This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin and binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thromboly activating the circulating can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating constination activation process to the site of pathological thrombus. This overcomes systemic plasminogen co the site of pathological thrombus. This overcomes systemic plasminogen co the site of pathological thrombus. This overcomes systemic plasminogen co 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                    Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin.

                                                                                                                                                                                                                                              This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid Lasminogen activator (FA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (FG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain colypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating being characteries of blasminogen to plasmin, thus adding in the localisation of the blasminoder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     #X#X##X#X#
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable pronounced duration, or lag, after exposure of the PA to a suitable propaptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of neural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed action thrombolysis). The proteins the production into the can bind tightly with fibrin in blood closs soon after introduction into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               642

                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (FA) comprises a polypeptide fulsion between streptokinase (SK), which are capable of plasminogen (FG) activation, and fibrin binding regions of human fibronectin, which are from fibrin and binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of ardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus adding in the localisation of the plasminogen activation encountered during clinical use of streptokinase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated bacterial protein that induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising a diministering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase protein; a compression vector comprising (1); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising bacterial fibrin-dependent plasminogen activator is useful for dissolving clocal clots in patients with a thrombotic condition, e.g. myocardial infarction, venous thrombosis, pulmonary embolism, cerebral thrombosis, and arterial thrombosis and arterial thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of presence of fibrin than in the absence of fibrin. The modified creptokinase has at least 10-fold, preferably 100-fold greater in nactivates as treptokinase has at least namino acid substitution that inactivates a creptokinase as a streptokinase and maltose binding protein fusion protein from a common of the streptokinase at least two-fold. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptococcus; streptokinase; fibrin-dependent plasminogen activator; nSK; rSK; bacterial; blood clot; thrombotic condition; myocardial infarction; venous thrombosis; pulmonary embolism; cerebral thrombosis; graft thrombosis; arterial thrombosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a fusion protein or a conjugate comprising a vasodilator polypeptide, or its active fragment, and a thrombolytic polypeptide or its active fragment. The protein is useful for treating a subject suffering from a partially or totally occluded blood vessel, causing unstable angina, acute myocardial infarction or stroke. The polymotlectide encoding the polypeptide is useful in gene therapy. The vasodilatory action of the protein allows for the use of lower doses of a thrombolytic while maintaining the clot dissolving effectiveness of the thrombolytic, and the use of lower doses of the thrombolytic, and the use of lower doses of the thrombolytic, and the use of lower doses of the thrombolytic reduces associated side effects. The present sequence is the plasmid used for the preparation of Maxadilan-Streptokinase fusion protein. It contains maxadilan cDNA, which encodes a vasodilator peptide produced by the salivary gland of the New World sand fly, and streptokinase cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New fusion protein or conjugate, useful for treating unstable angina, acute myocardial infarction or stroke, comprises a vasodilator polypeptide and a thrombolytic polypeptide, or active fragments of the polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        6040 AAATTTTTTGAAATCGATCTAACATCACGACCTGCTCATGGAGGAAAGACAGAGGCAAGGC
